CS:APP Chapter 4 Computer Architecture Logic Design

Yuan Tang

Adapted from CMU course 15-213

http://csapp.cs.cmu.edu

Overview of Logic Design

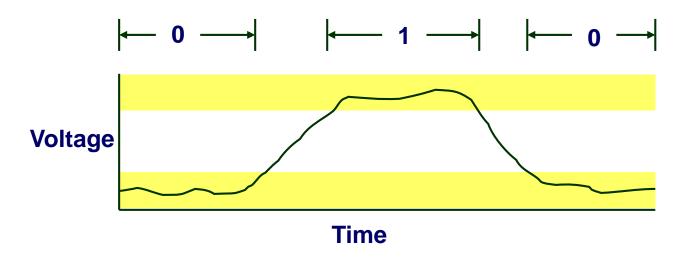

Fundamental Hardware Requirements

- Communication
 - How to get values from one place to another
- Computation
- Storage

Bits are Our Friends

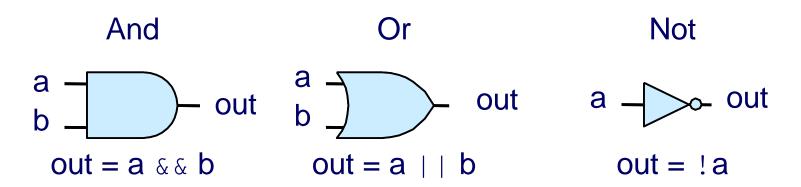

- Everything expressed in terms of values 0 and 1
- Communication
 - Low or high voltage on wire
- Computation
 - Compute Boolean functions
- Storage
 - Store bits of information

Digital Signals

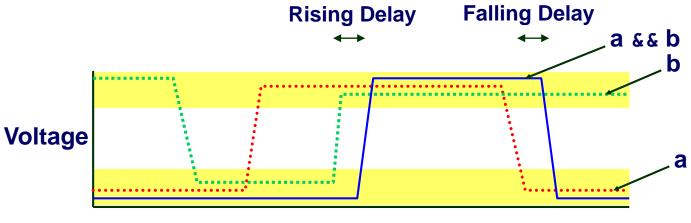

- Use voltage thresholds to extract discrete values from continuous signal
- Simplest version: 1-bit signal
 - Either high range (1) or low range (0)
 - With guard range between them
- Not strongly affected by noise or low quality circuit elements
 - Can make circuits simple, small, and fast

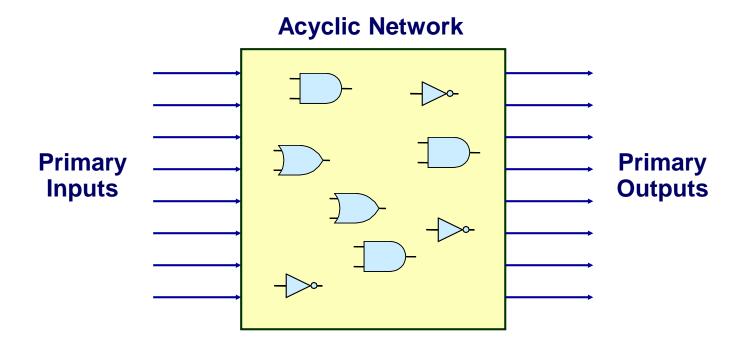

Computing with Logic Gates

- Outputs are Boolean functions of inputs
- Respond continuously to changes in inputs
 - With some, small delay

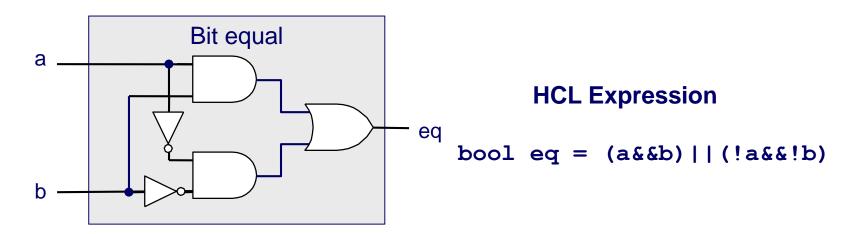

Combinational Circuits

Acyclic Network of Logic Gates

- Continously responds to changes on primary inputs
- Primary outputs become (after some delay) Boolean functions of primary inputs

Bit Equality

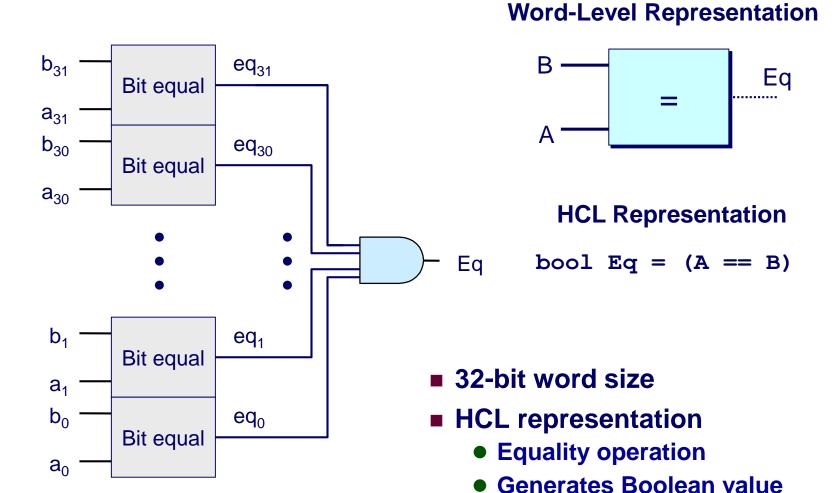

Generate 1 if a and b are equal

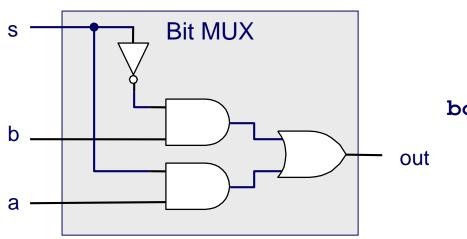

Hardware Control Language (HCL)

- Very simple hardware description language
 - Boolean operations have syntax similar to C logical operations
- We'll use it to describe control logic for processors

Word Equality

Bit-Level Multiplexor

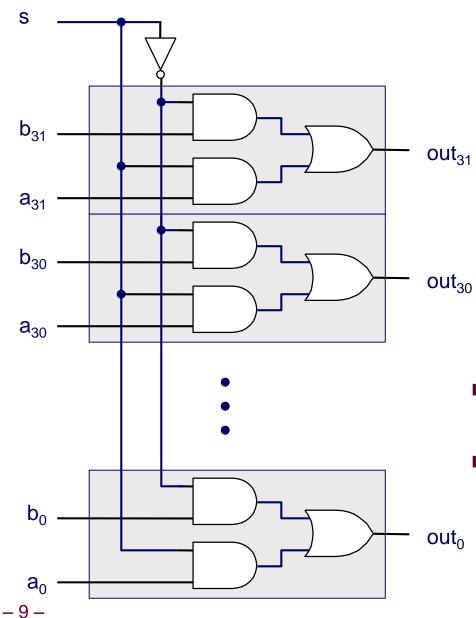

HCL Expression

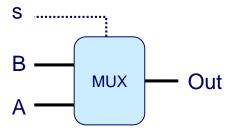

bool out = (s&&a) | | (!s&&b)

- Control signal s
- Data signals a and b
- Output a when s=1, b when s=0

Word Multiplexor

Word-Level Representation

HCL Representation

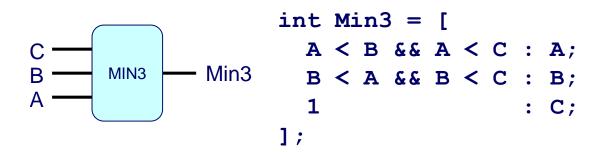

```
int Out = [
   s : A;
   1 : B;
1:
```

- Select input word A or B depending on control signal s
- **HCL representation**
 - Case expression
 - Series of test : value pairs
 - Output value for first successful test

CS:APP2e

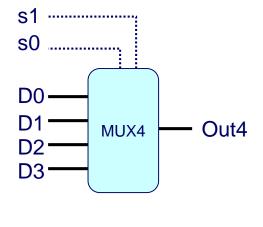

HCL Word-Level Examples

Minimum of 3 Words

- Find minimum of three input words
- HCL case expression
- Final case guarantees match

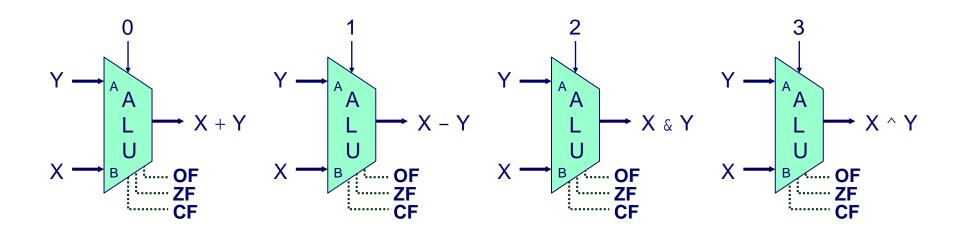

4-Way Multiplexor

```
int Out4 = [
 !s1&&!s0: D0;
!s1 : D1;
!s0 : D2;
1 : D3;
];
```

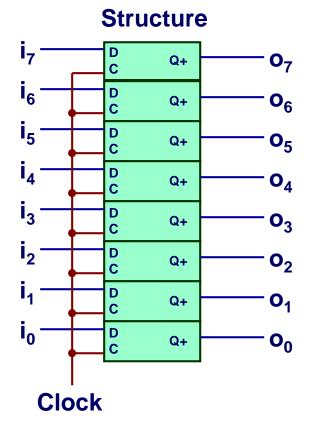

- Select one of 4 inputs based on two control bits
- HCL case expression
- Simplify tests by assuming sequential matching

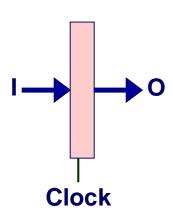

Arithmetic Logic Unit

- Combinational logic
 - Continuously responding to inputs
- Control signal selects function computed
 - Corresponding to 4 arithmetic/logical operations in Y86
- Also computes values for condition codes

Registers

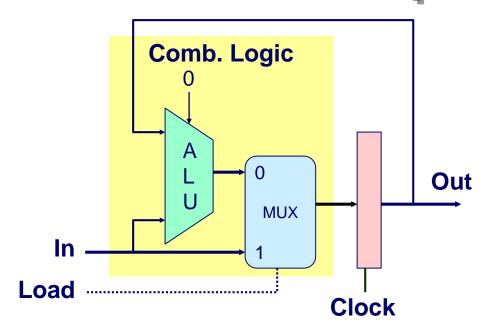

- Stores word of data
 - Different from program registers seen in assembly code
- Collection of edge-triggered latches
- Loads input on rising edge of clock

Register Operation

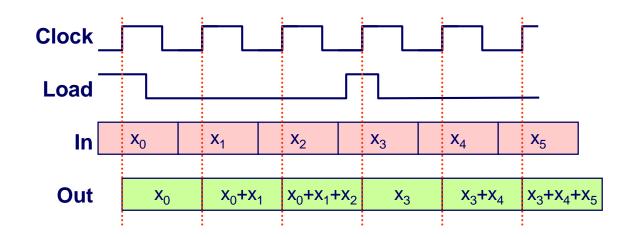

- Stores data bits
- For most of time acts as barrier between input and output
- As clock rises, loads input

State Machine Example

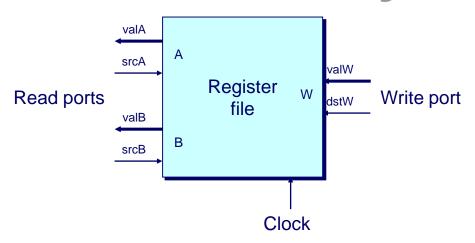

- Accumulator circuit
- Load or accumulate on each cycle

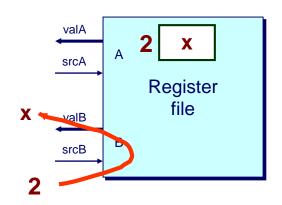

CS:APP2e

Random-Access Memory

- Stores multiple words of memory
 - Address input specifies which word to read or write
- Register file
 - Holds values of program registers
 - %eax, %esp, etc.
 - Register identifier serves as address
 - » ID 15 (0xF) implies no read or write performed
- Multiple Ports
 - Can read and/or write multiple words in one cycle
 - » Each has separate address and data input/output

Register File Timing

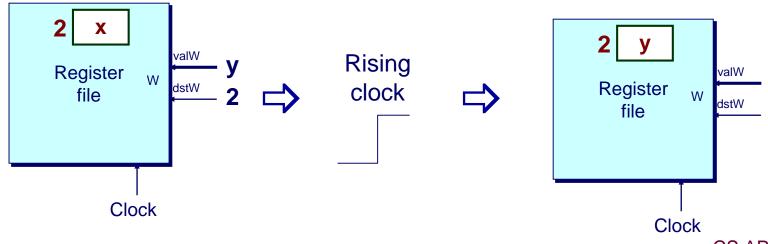

Reading

- Like combinational logic
- Output data generated based on input address
 - After some delay

Writing

- Like register
- Update only as clock rises

Hardware Control Language

- Very simple hardware description language
- Can only express limited aspects of hardware operation
 - Parts we want to explore and modify

Data Types

- bool: Boolean
 - a, b, c, ...
- int: words
 - A, B, C, ...
 - Does not specify word size---bytes, 32-bit words, ...

Statements

- bool a = bool-expr ;
- int A = int-expr;

HCL Operations

Classify by type of value returned

Boolean Expressions

- Logic Operations
 - a && b, a || b, !a
- Word Comparisons

```
• A == B, A != B, A < B, A <= B, A >= B, A > B
```

Set Membership

```
    A in { B, C, D }
    Same as A == B | | A == C | | A == D
```

Word Expressions

- Case expressions
 - [a: A; b: B; c: C]
 - Evaluate test expressions a, b, c, ... in sequence
 - Return word expression A, B, C, ... for first successful test

Summary

Computation

- Performed by combinational logic
- Computes Boolean functions
- Continuously reacts to input changes

Storage

- Registers
 - Hold single words
 - Loaded as clock rises
- Random-access memories
 - Hold multiple words
 - Possible multiple read or write ports
 - Read word when address input changes
 - Write word as clock rises
